

ABSTRACT

This project "TRAVELJET" is providing information like places, hotels, and packages for tourists. This project has designed HTML-PHP frontend and Microsoft SQL server 2002 backend which works in any browsers. The coding language used HTML and PHP.

Traveljet System is used to book a package from anywhere in the world by a single website which will help the user to know all about the places and package details in a single website.

User Module:

Main modules are Registration, View Place, Place Information, View Hotel Information, Package booking.

Admin Module:

Administration module can provide hotel information, package details, and place information for users. The Admin can manage user information and view daily, monthly and weekly reports. This module is made for the admin of the website and admin can make changes in the data related to places, hotels, and package details.

- .Organize User Information
- .Organize Place Information
- .Organize Hotel Information
